Event Submission Guidelines

What to submit, how to prepare it, and what judges look for

1. Overview

Each participant or team must choose **only one** of the 6 problem statements provided and submit a complete entry. Your submission must include the four items below. Incomplete submissions may not be evaluated.

#	Deliverable	Format
1	GitHub repository	Public link (with README)
2	Presentation (PPT)	PPT / PPTX file
3	Deployed project	Live, working URL
4	Explanation video	3–5 minutes, voice-over only (no face needed)

2. Choosing Your Problem Statement

- Select **one** problem statement out of the 6 provided. Submissions covering multiple statements are not allowed.
- Read the requirements carefully before you start building.
- Make sure your solution directly addresses the statement you chose.

3. GitHub Repository

- Submit the repository link (make sure it is accessible to the organizers).
- Include a clear **README**: project name, problem statement chosen, features, tech stack, and setup/run instructions.
- Keep the code organized, with meaningful commit history.
- Do not commit secrets, API keys or passwords; use environment variables and provide a `.env.example`.

4. Presentation (PPT) – Required Content

Your PPT must cover the following sections. Keep slides clean, visual and to the point.

Section	What to include
Problem Statement	The problem you chose, who is affected, and why it matters.
Existing System	How the problem is solved today, and its limitations or gaps.
How Your Solution Is Different	What is new or better in your solution compared with the existing system.

Section	What to include
Approach	How you solve it: methodology, workflow and key design decisions. Explain how your approach differs from the usual one.
Tech Stack & Architecture Diagram	Technologies, frameworks and tools used, with an architecture diagram showing components and data flow.
Conclusion	Summary of the solution, impact, and possible future scope.

5. Deployed Project Link

- Deploy your project on a hosting platform and share the live URL.
- Test the link before submitting: it must open without errors and demonstrate the core features.
- If login is required, provide test credentials in the README or submission form.
- Make sure the deployment stays online until results are announced.

6. Explanation Video (3–5 Minutes)

- Length: **3 to 5 minutes**.
- You do **not** need to show your face. A screen recording with voice-over is enough.
- Explain the problem and the requirements so that a viewer understands what you were asked to build.
- Walk through your solution, demo the key features, and briefly explain how it works.
- Use clear audio and a readable screen resolution.

Suggested video outline

Time	Content
0:00 – 0:45	Problem statement and requirements
0:45 – 1:30	Existing system and its gaps
1:30 – 3:30	Your solution: live demo and approach
3:30 – 4:30	Tech stack and architecture
4:30 – 5:00	Conclusion

7. Final Submission Checklist

Done	Item
[ ]	Chose only one of the 6 problem statements
[ ]	GitHub repository link is public and has a README
[ ]	PPT covers: problem, existing system, differentiation, approach, tech stack + architecture diagram, conclusion
[ ]	Deployed project link works
[ ]	Video is 3–5 minutes and explains the requirements and solution
[ ]	All links submitted through the official submission form
